## Thesis

Explicit consideration of anticipatory mechanisms, as observed in music cognition, within a computational framework, could
O Address "complex" problems in computer music,
O Reduce complexity of computation and design,
O and Provide access to temporal structures of music information as they unfold in (real) time, for creative applications (computer music).

## Motivations

## Role of expectations in musical experience

- In listening experience

O Expectations imply mental representations in which our daily musical experience is being examined and updated.
O Major responsibility for musical emotions

- In musical creativity

O Meyer (1954): composition = choreography of musical expectations
O Huron (2006): Demonstrates explicit cases of these "choreographies"
O Grisey (I987):"A composer's reflections on musical time"
O The skin of time
O From the time of music to the music of time...

- No major consideration for expectation in computer music

## Approach

- A voyage from the domain of natural science to the science of the artificial
O Define and clear out the context
O From modeling anticipation to anticipatory modeling
O Modeling anticipation: Research in music cognition literature for the study of musical behavior pertaining to expectations
O Anticipatory modeling: A cognitive design principle for modeling artificial systems.
- Propose anticipatory models addressing three main preoccupations of musical expectations:
O What to expect
O How to expect
O When to expect

## PART (I)

Music Cognition

Modeling Investigations

"I think that the search for a universal answer to the questions raised by musical experience will never be completely fulfilled; but we know that a question raised is often more significant than the answer received. Only a reckless spirit, today, would try to give a total explanation of music, but anyone who would never pose the problem is even more reckless."

Remembering the future
Luciano Berio

Natural Science

Artificial Science

## From Modeling Anticipation to Anticipatory Modeling

# Anticipation, Expectation, Prediction 

## Definitions?

- Prediction: Act of forecasting based on previously gained knowledge from an environment.
- Expectation: "a form of mental or corporeal belief that some event or class of events is likely to happen in the future." (Huron 2006)
- But anticipation...

O Huron (2006): Anticipation is "a sub-product of expectation when the sense of appraisal for the expected future event is high."
O Bharucha (96) calls this arnin
O Narmour (90) calls this plica $n$.
O Schmuckler (97): "Expecration is an anricipation of upcoming events based on information from pa and esent

## Psychology of Musical Expectation

ircam

## Fact Constitution

I. Expectations entail mental representations, whether partial, accurate or fallible.
2. Expectations are learned through interactions with a surrounding environment (auditory learning)
O The determinant factor for learning auditory phenomena is their stability in the surrounding environment
O Statistical nature of auditory learning
3. Concurrent and Competitive Representations

O Listeners appear to possess multiple representations for the same phenomena (concurrency)
O Expectations are differentially favored depending on their predictive success (competitive)
4. Expectations lead to predictions, which by themselves evoke actions (physiological, mental or physical)
O Expectations are always coupled with their consequent actions
O In theory and also in practice....

## What is Anticipation?

We study the activism aspect of expectation under the term Anticipation:

```
Definition Anticipation is an action, that a system takes as a result of pre-
diction, based on current belief or expectations, including actions on its own
internal state or belief.
```

- Implications:

O Expectations demand constant adaptation and interaction with an environment

O Anticipation is an activity of coupling with the environment.
O Anticipation is not a process in the brain, but a kind of skillful activity and a mode of exploration of the environment.

## Modeling Investigations

- What is modeling?

O In natural sciences, by modeling musical expectations researchers aim at
0 assessing a theory regarding one among many aspects of the psychology of musical expectations

- Things to be aware of...
(A) Imperfect Heuristics

O Recall "fact I": Consequent mental representations out of auditory learning can be fallible.
O We are selective and imperfect learners, constrained by all problems of induction.
O Biological goal of expectation vs. Musical goal of expectation
0 Biological goal: Faulty heuristics $\square$ Potential danger
O Musical goal: Every danger is... welcome!
O Our senses are biased through the world!

## Modeling Investigations

- Things to be aware of...
(B) Naive Realism

O Naive Realists consider senses as unbiased windows through the real world.
O A sobering point for music theorists!
O Considering that the structures seen in notations are the ones we experience, and what is experienced is what is seen in the notation.
O The majority of music theoretic models of expectation undergo naive realism.
O Example: The story of post-skip reversal
O Common perception pattern among western-listeners
O Adopted by many music theory researchers as an "rule"
 underlying melodic expectation (Narmour, Lerdahl, Margulis).
O Not true!
O Von Hipple and Huron (2000) show that post-skip reversal in music scores is the result of a less exciting phenomena.
O Except in the music of Giovanni Palestrina, the initiator of the rule.

## So... Should we "model" anticipation?

Revise the question!

## Modeling Musical Anticipation

## Modeling Investigations

## Reactive Frameworks

- Computational models based on causality

O Action is the result of a belief based on the past and present
O A universal framework:
Given any mode of system behavior which can be described sufficiently accurately, there is a purely reactive system which exhibits precisely this behavior
O Practical problems for modeling cognitive behavior
O Representations are fallible! (no accurate description)
O Not all forms of cognitive interactions can be transcribed or assumed as disposed
O would not necessarily generalize to unknown situations.

## Anticipatory Modeling

## Definition

- Anticipatory behavior:

A process or behavior that does not only depend on the past and present but also on predictions, expectations or beliefs about the future.

- Anticipatory Modeling is the design process for anticipatory systems:

> Definition An Anticipatory System is a system containing a predictive model of its environment, which allows it to change state at an instant in accord with the model's predictions pertaining to a later instant.

- In contrast to Modeling Anticipation:

O No attempt to provide a universal framework for anticipatory behavior, but to provide models that anticipate.
O Considers Anticipation as the fore-front concept in cognitive system design to achieve complex systems.

## Anticipatory Modeling

## Modeling Anticipation vs.Anticipatory Modeling

- Modeling Anticipation: An effort to explain musical behavior, as in natural sciences.
- Anticipatory Modeling :

O A design process that addresses anticipatory behavior observed in music.
O Complexity a result of adaptation... .
O To avoid naive realism, and problems of imperfect heuristic

## PART (II)

What to Expect

## Music Information Geometry

## Motivations

- To represent relevant and stable part of information arriving from the environment
- Classical Information Theory

O Few answers to the representation and fidelity concerns

- Advances in Machine Learning

O MIR Techniques based on measures of self-similarity
O Lack of consideration for time

- Bring the two literatures together
$\Rightarrow$ Information Geometry

## Information Geometry

## Motivation

Consider the problem of extracting structures of musical information:

O Extracting this kind of information from a symbolic score is trivial, but a difficult problem in the signal domain.
O Specially with no a priori knowledge of music
o Worse in real time!
O Goal: To make this possible and more...
O To obtain methods of access to structures of music signals
O A general framework to fill in the following gap for musical applications:

## Information Geometry

## Intuition

- Consider the following geometry:

0 Points are probability distributions $p(x, \xi)$ (instead of dots)
O Distance between two points is some measure of information between them

- Welcome to the world of Information Geometry!

O Geometric manifolds with information metrics on probability space
O Marriage of Differential Geometry, Information Theory, and Machine Learning
O Considering probabilistic representations as well-behaved geometrical objects, with intuitive geometric properties
O Spheres, lines (geodesics), rotations, volumes, lengths, angles, etc.

- Getting real...

O Riemannian Manifolds over probability spaces with Fisher Information measure
O Characterized by the type of employed distance (called divergences)
O Our interest, canonical elements:
O Space of exponential distributions
O with Bregman divergences
O Bijection between the two

## Information Geometry

## Elements of Bregman Geometry

- Bregman Centroids

O Significant property (Thm 4.1)
O The "right type" centroid is independent of the choice of Bregman divergence and is equal to the mean:

- Bregman Balls

O In analogy to Euclidean geometry, we can define balls using Bregman divs,
centered at ${ }^{\mu_{k}}$ with radius $R_{k}$

- Bregman Information of a random variable $X$

O Defined as the expectation over divergences of all points from the centroid
O Special cases: variance, mutual information

## Music Information Geometry

## General Framework

- Points $=$ time domain windows of audio signal $\boldsymbol{X}_{t}$, represented by their frequency distributions $\boldsymbol{S}_{t}(\omega)$
O Arriving incrementally / in real time
O Corresponding to normalized log-scale Fourier transform amplitudes
O Mapped to Multinomial points in the information geometry (one-to-one)
O Corresponding Bregman divergence is Kullback-Leibler divergence
O Therefore, Bregman Information is equivalent to mutual information

Goal: To capture, represent and qualify the information structure of audio data streams.

## Music Information Geometry

## Approach

- Do not formalize information content!
- Control changes of information content instead

O Using some metric d, that gives rise to the notion of similarity:
Definition Two entities $\boldsymbol{\theta}_{0}, \boldsymbol{\theta}_{1} \in \mathcal{X}$ are assumed to be similar if the information gain by passing from one representation to other is zero or minimal; quantified by $d_{X}\left(\boldsymbol{\theta}_{0}, \boldsymbol{\theta}_{1}\right)<\epsilon$ which depends not on the signal itself, but on the probability functions $p_{X}\left(x ; \boldsymbol{\theta}_{0}\right)$ and $p_{X}\left(\boldsymbol{x} ; \boldsymbol{\theta}_{1}\right)$.

- Candidates for $\mathrm{d}(.,$.$) :$

O Information Rate (IR) of Dubnov $(2005,2008)$
O Data-IR: For stationary signals
O Model-IR: Between sub-sets of quasi-stationary signals

## Music Information Geometry

## Appoach

- Proposal: Use the bijected Bregman divergence of the information geometry of audio data streams
- Data-IR:

O Is proven (mathematically) to be equal to Bregman Information

- Model-IR:

O Requires segmenting audio stream into chunks.
O Proposal:
Definition Given a dual structure manifold $\left(\mathcal{S}, g, \Delta^{D}, \Delta^{D^{*}}\right)$ derived on a regular exponential family formed on data-stream $X_{k}$, a model $\theta_{i}$ consist of a set $\mathcal{X}_{i}=\left\{\boldsymbol{x}_{k} \mid k \in \mathcal{N}, \mathcal{N} \subset \mathbb{N}\right\}$ that forms a Bregman Ball $B_{r}\left(\boldsymbol{\mu}_{i}, R_{i}\right)$ with center $\boldsymbol{\mu}_{i}$ and radius $R_{i}$.

## Music Information Geometry

## From Divergence to Similarity Metric

- Further requirements for d :

O symmetric

$$
\begin{gathered}
d(\boldsymbol{x}, \boldsymbol{y})=d(\boldsymbol{y}, \boldsymbol{x}) \\
d(\boldsymbol{x}, \boldsymbol{y}) \leq d(\boldsymbol{x}, \boldsymbol{z})+d(\boldsymbol{z}, \boldsymbol{y})
\end{gathered}
$$

O and to hold the triangular inequality
to obtain equivalent classes.

- Problem: Bregman divergences are neither symmetric, nor hold the triangular inequality!
- Solutions: (Nielsen and Nock, 2007)
a. Triangular inequality hold IFF $y$ is the geometric projection of $x$ onto the tangent plane passing through zy.

b. In our geometry, the notions of max. likelihood and projection are equivalent! (Proposition 4.1)
c. Symmetrize Bregman divergence using a max. likelihood formulation!

We can approach both notions of symmetry and triangular inequality.

## Music Information Geometry

## Model Formation

- Incrementally segment information regions into quasi-stationary chunks

O A model is a Bregman ball whose information radius reveals the maximum distance in terms of mutual information within the ball.
O Detect balls with jumps in information distance between a new point and a forming ball
O Assume a fixed information radius $R$ to detect jumps and account for continuity of information change.
O Computationally cheap: Only comparing with the last

Modeling Musical Anticipation

## Music Information Geometry

## Incremental Segmentation

- Sample Result: Beethoven's first piano sonata, first movement

O performed by Friedrich Gulda (1958)
Piano Sonate Opus 2 No 1 (1st Mov., 1st theme)

Modeling Musical Anticipation

## Methods of Information Access

## Incremental Structure Discovery

- Idea: The models in music information geometry provide instantaneous similarities between consequent models.
O What about similarities between subsets of models at different time intervals?

O What about grabbing long term regularities in the music signal?

- Literature of Audio Structure Discovery algorithms: Usually off-line and/or incorporate a priori beliefs over music structure
- Our goal:

O Do it online and incrementally as audio signals arrive
O Grab and learn regularities on-the-fly from the signal itself and without a priori knowledge
O Key for Anticipatory Modeling: Grabbing stabilities and regularities of information in the environment

## Methods of Information Access

## Incremental Structure Discovery

- Proposal: Extend an existing algorithm in the symbolic domain to the continuous audio domain by passing through information geometry and Models.
- Point of departure: Factor Oracles

O Used primarily on text and DNA data to detect repeating structures.
O A finite-state automaton learned incrementally.
O A state-space representation of repeating structures in a sequence

O Provides forest of suffix tree structures
O The beauty of MIG

O Keep the algorithm, replace symbols by models or points and equivalence by similarity in a music information geometry!
$\Rightarrow$ Audio Oracle

## Methods of Information Access

- Audio Oracle results

O On points: (each state=one analysis window)
O Natural bird uttering (natural repetition)
O Using MFCC audio features on Multinomial music information geometry

Modeling Musical Anticipation
Part II. What to Expect

## Methods of Information Access

- Audio Oracle results:

O On models
O Beethoven's first Piano Sonata,Third Movement (Gulda, 1958)
O Using Constant-Q amplitude spectrum on Multinomial music information geometry O 150 seconds, > 9500 analysis frames, resulting to 440 states

Modeling Musical Anticipation
Part II. What to Expect

## Methods of Information Access

## Fast Information Retrieval

- Proposal: Compile an search engine over a database of audio and using an outside audio query
O That is also capable of recombining/reassembling chunks of audio within a large target, to reconstruct the query.
- Related works: Concatenative Synthesis, Unit Selection
- Idea: Do not search on the audio itself but on audio structures

O Audio Oracle as Meta data
O (ab)use the long-term structures of Audio Oracle to maintain perceptual continuity of the results (access to long term structures)

- Simple Dynamic Programming algorithm:

O Follow the forest of suffix tree structures to find the longest and best possible result
O Maintains all the results (paths) at all times!

Modeling Musical Anticipation

# 둔UCSD <br> <br> Methods of Information Access 

 <br> <br> Methods of Information Access}

## Guidage Results

- Self-Similarity test

O Task: Search for the first theme of the first Beethoven's sonata in the entire sonata.
O Query:Audio of the first theme
O Target:The entire first sonata's Audio Oracle (650 states)

(10)-(0):-0.) Modeling Musical Anticipation

Part II. What to Expect

## Methods of Information Access

## Guidage Results

- Database Search

O Task: Find audio, or a recombination within a file that are similar to query
O Query: African drum sample
O Database: Loop database (Kontakt) 140 audio files, 200Mb, Mean duration 7s
O Convergence time: 20s in Matlab on a 2.3Ghz unicore Intel machine

## PART (III)

## How to Expect

## Adaptive and Interactive Learning

## How what?

- We just saw how in interaction with an environment,

O We can capture the regularities in the information structure,
O represent it,
O and have (fast) access to it.

- Anticipation is expectations or beliefs of a system bound to actions

O We need to know how to act
O We need to learn interactively the consequence of actions in the environment, take lessons, and adapt ourselves to new situations

Adaptive and Interactive Learning

## Automatic Improvisation

- We showcase this part on the problem of Automatic Improvisation and Style imitation
O Existing systems are based on predictions on learned context models
O We extend this to Anticipation through anticipatory modeling
o DISCLAIMER:
O No interest in imitating or recreating Bach!
O To show that anticipatory learning provides ways to learn and act to gain longterm complex structures
O With no a priori knowledge or incorporated rules
O With presence of little data
O With relative cheap computation and design
- In this part, we focus on symbolic data (MIDI signals, scores)

## Adaptive and Interactive Learning

## General Framework

- The system comprises of agents and its environment, interacting at all times. At each interaction cycle,
O The system perceives the state of the environment
O Select actions based on some belief
O Based on this action, the environment might change state

O and a reward/punishment signal might be sent to the agent.

- Design elements:

O Agent: Computer improvisor,
O Multiple agents [fact 3]
O Environment: Human performer/Music Score
o Dynamics of the environment $\underset{\sim}{ }$ state transitions

- Interactions rewards/guides for learning

O Actions: Music generations by the computer
O Policies:Values associated to state-actions

O used during generation/decision-making, learned during interactions

## Modeling Musical Anticipation

## Adaptive and Interactive Learning

## General Framework

- Problems to solve:
I. How to represent the environment (memories/musical representations)?
[ Use Factor Oracles (symbolic data), Audio Oracle (continuous data) to model regularities in the environment

2. How to incorporate interaction? (rewards)

V Use Guidage to reinforce recurrent structures and retrieve regularities
0 At each interaction, reinforce the states in the memory that are factors of the new incoming sequence (from the environment).
3. How to learn?
a. Learning the dynamics of the environment
$\square$ Use the Oracle incremental updates
b. Learning policies for action decisions

- Active Learning algorithm... .

Adaptive and Interactive Learning

## 1. Musical Representation

- Using multiple attributes each treated as an independent sequence:

Modeling Musical Anticipation

## Adaptive and Interactive Learning

## 1. Musical Representation

|  | Event Number $I_{t}$ | $\boldsymbol{I}_{1}$ | $\boldsymbol{I}_{2}$ | $\boldsymbol{I}_{3}$ | $\boldsymbol{I}_{4}$ | $\boldsymbol{I}_{5}$ | $\boldsymbol{I}_{6}$ | $\boldsymbol{I}_{7}$ | $\boldsymbol{I}_{8}$ | $\boldsymbol{I}_{9}$ | $\boldsymbol{I}_{10}$ | $\boldsymbol{I}_{11}$ | $\boldsymbol{I}_{12}$ | $\boldsymbol{I}_{13}$ | $\boldsymbol{I}_{14}$ |

Modeling Musical Anticipation
Part III. How to Expect

## Adaptive and Interactive Learning

## II. Interaction Modes

- Two modes:

O "Interaction mode": (left) interacting with an environment, receiving rewards (or guides) and constructing knowledge.
O "Self-listening mode": (right) During automatic generation. Reflecting on the changes in the environmental context caused by the system itself.

Modeling Musical Anticipation

## Adaptive and Interactive Learning

## Anticipatory Learning

- Goal: To maximize rewards on each action by updating the policy of each state-action pair (reinforcement learning).
O Rewards on a future horizon: $\quad R\left(s_{t}\right)=\sum r\left(s_{t}, a_{t}\right)+\gamma r\left(s_{t+1}, a_{t+1}\right)+\cdots+\gamma^{m} r\left(s_{t+m}, a_{t+m}\right)+\cdots$
O Predicting possible steps and evaluating them
O Similar to the idea of a rehearsing musician
O Updates on selected state-actions by Guidage at each interaction cycle
- Competitive and Collaborative Learning

O Choose the winning agent at each cycle
O Follow the winner for updates during in that episode.
O Upon each update, influence relevant states in other agents

## Adaptive and Interactive Learning

## Sample Generation

- Learn sequentially on J.S.Bach’s "Two-part Invention, Book II, Nr. 3"
- Generate (self-listening mode) using the gained knowledge

Improvisation Session after learning on Invention No. 3 by J.S.Bach

Modeling Musical Anticipation
Part III. How to Expect

# 둔UCSD <br> <br> Adaptive and Interactive Learning 

 <br> <br> Adaptive and Interactive Learning}

## Generalization

- As a result of collaborative learning and generation

O Preliminary evidence of long-term planning and complex structures
O No a priori knowledge of the domain

- Fast learning and generation

O Little data needed for training
O with many questions to ask and directions to pursue

Modeling Musical Anticipation

## PART (IV)

## When to Expect

## Anticipatory Synchronization

## Motivations

- Technical
- Score Following problem

O Real Time Audio to Symbolic Score Synchronization
O More focus on acoustic features, less emphasis on time

- Coordination problem

O Musicians employ various sources for synchronization
O Expectations about future events play a role as important as the musical events themselves.

- Musical

O Extend the score following paradigm
O At the Time of Composition: Enable concurrent and flexible representations of events/time.

O At the Time of Performance: Bring in the composition on stage by the virtue of interpretation of the written score.
$\rightarrow$ Towards a "writing" of Time and Interaction in Computer Music
Modeling Musical Anticipation
Part IV. When to Expect

## General Architecture

- Time of Composition:

O One score containing declarative instrumental events and electronic actions

O Concurrent Representations
O Concurrent event time-scales

- Time of Performance:

O Two collaborative and competitive agents: Event Agent and Tempo Agent
O Interpreting and giving life to score parameters and written time structures

## Probabilistic Models of Time

- Concern: Uncertain nature of time occupancy of musical events (neither deterministic nor arbitrary)
- Two mainstream views:
I. Non-Parametric Markov Occupancy Models

2. Semi-Markov Occupancy Models

- One (and only one) state per macro-event!
- But with an Explicit distribution $d_{j}(u)$ for time occupancy of each event $j$

## Probabilistic Models of Time

## Proposal

- Use advantages of both worlds:

O Hybrid Markov/Semi-Markov Models

- Collaborative and Competitive Inference

O Use predicted tempo to anticipate (and prepare for) future events!
O Coupling event (audio) and tempo agents instead of cascading!
O Adaptive/online learning

- Advantages:

O No need for offline training of the system
O Reduce in number of parameters
O No need for strong acoustic model!

## Observers

- Are the "eyes and ears" of the system during live performance!

O Traditionally pitch only
O Recently: Raw audio (audio matching), gesture (gesture following), Audio features,Video streams, etc.

- Proposal: Concurrent Observations
- Hard-coded Audio Observer for Polyphonic Events:

O Compare real time audio spectrum to pre-constructed harmonic templates out of the score.

0 Normalized Audio Spectrum $\Rightarrow$ Multinomial Dists $\Rightarrow$ Use KL divs

Modeling Musical Anticipation

## Antescofo's Score Semantics

- Simple (and young) text-based and declarative language for writing of time and interaction
- Important Specificity:

O Co-existence of instrumental score and electronic actions.

O Bridging the gap between the time of composition to time of performance
O Actions can be written in relative time, whose values are evaluated at runtime (live performance), coupled with real-time tempo

Modeling Musical Anticipation

## Antescofo

## Antescofo has been used...

- "... of Silence", Marco Stroppa, for Saxophone and chamber electronics (Antescofo Premiere)
- "Anthèmes 2", Pierre Boulez, forViolin and Live electronics
- "... Explosante-Fixe...", Pierre Boulez for flute, orchestra and electronics
- LA Philharmonic
- "Speakings", Jonathan Harvey for orchestra and live electronics
- BBC Scotish Orchestra
- and more to come...

## Evaluation

- Tempo Evaluation:

O Use synthesized audio from score to attain milli-second tempo precision
tempo $=60 \mathrm{BPM}$ on whole note

Accelerandos and decelerandos:

Discrete Tempo Change during performance:

(a) Waveform and alignment result

(b) Estimated and real tempi for acceleration and deceleration in BPM

Modeling Musical Anticipation
Part IV. When to Expect

## Evaluation

- Alignment Evaluation:

O MIREX 2006-08 Evaluation Campaign for Score Following
O Augmented the database to contain polyphonic music

| $\#$ | Piece name | Composer | Instr. | Files | Prefix | Events |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Explosante-Fixe | P. Boulez | Flute | 7 | t $x$-s $y$ | 615 |
| 2 | K. 370 | Mozart | Clarinet | 2 | k370 | 1816 |
| 3 | Violin Sonata 1 | J.S. Bach | Violin | 2 | vs1- | 2019 |
| 4 | Fugue BWV.847 | J.S. Bach | Piano | 1 | RA | 225 |

O Total Precision obtained $=\mathbf{9 1 . 4 9 \%}$
O Details in the manuscript

## Contributions

I. From Modeling Anticipation to Anticipatory Modeling
O Modeling Anticipation
O Anticipatory Modeling
II. What to Expect?

O Music Information Geometry
O Methods of Information Access
III. How to Expect?

O Anticipatory Learning in an environment
IV. When to Expect?

O Anticipatory Synchronization
O Towards a "writing" of time and interaction in computer music
V. Conclusions
$\boxed{\square}$ A formal of definition of anticipation destined for computational models of sound and music.
$\square$ A formal definition of anticipatory modeling inspired by music cognition.
I A mathematical framework for quantification and qualification of music information and content based on Information Geometry.
■ An online algorithm for incremental clustering and structure discovery of music signals.
$\square$ A fast and online algorithm for unit selection over large databases of music based on users' audio query.
$\square$ An online adaptive and interactive learning framework achieving anticipatory planning strategies, based on Active Learning.
■ A preliminary computational anticipatory
framework for automatic style imitation and automatic improvisation.
$\square$ An anticipatory design for real-time audio to score alignment featuring coupled audio/tempo agents and capable of decoding real-time position as well as tempo of the performer for polyphonic music signals. $\square$ A preliminary framework and language for writing of time and interaction destined for interactive mixed instrumental and live computer music repertoires
